move technology Optimizes Internal Processes with In-House Developed Software

move technology GmbH develops customized digital solutions for its customers, combining expertise in software development, artificial intelligence, and engineering. The company applies this same approach to improving its own business processes. To increase operational efficiency and support future growth, move technology has restructured existing workflows and digitally interconnected its internal systems.

A key component of the project is the in-house development of an overarching software architecture. The integration of different applications, as well as customized features and user interfaces, were designed and programmed by move technology itself. The company combines its own software solutions with established commercial applications, bringing them together into a fully integrated system.

The new system architecture reduces manual interfaces, shortens information flows, and accelerates the processing of business and financial data. Information from different departments is consolidated centrally, making it available more quickly and transparently for analysis and informed business decisions.

Another key focus is the secure and reliable processing of sensitive company data. To achieve this, the existing IT infrastructure has been strategically expanded. By developing and integrating its own solutions, move technology maintains control over essential business processes, reduces dependencies on external service providers, and can flexibly adapt the overall system to future requirements.

“Anyone who wants to drive innovation forward must also ensure that their own structures are ready for the future. With our in-house developed software and the intelligent integration of existing applications, we are laying the foundation for the sustainable and efficient development of our company,” explains Dr. Jörn Seebode, Managing Director at move technology.

The result is a modular digital system architecture that integrates existing applications and can be expanded with additional features as needed. At the same time, the project demonstrates how customized software development and intelligent system integration can also be applied within a company's own operations to improve efficiency and create long-term value.

About move technology GmbH

Through technology, we are shaping an ecologically and economically strong world.

We are dedicated to bringing innovations to life worldwide, enabling our customers to become the global market leaders of tomorrow. Our starting point is always market and customer needs. In our projects, we combine strategy, engineering, software and our own products to create sustainable, practical solutions. This allows us to identify opportunities and develop the right solutions. Our core strengths lie in the fields of green energy, robotics and industrial artificial intelligence.

Founded in 2022, move technology is headquartered in Chemnitz, Germany, with additional offices in Dresden, Leipzig and Nienburg/Weser. We also have a presence in Kenya, South Africa and Canada.
